Executive Summary

Numerous stream segments in the Bayou Teche watershed are listed for sediment related issues on the 1999 court-ordered 303(d) list for Louisiana. Twenty segments are listed as having impairments related to total suspended solids (TSS), four are listed as having general siltation limitations and two have turbidity as a cause of impairment. A watershed approach was used in developing this TMDL. This approach is most appropriate when addressing predominately nonpoint source issues such as sediment where inputs are distributed throughout the watershed. The TMDL establishes a relationship between the three specific listings relating them all ultimately to the primary source, sediment load.

This sediment loading TMDL addresses all twenty one listed segments in the Bayou Teche watershed. The TMDL establishes a relationship between the three specific listings relating them all ultimately to the primary concern of sediment load. Target load estimates were developed from regression analysis relationships between turbidity and total suspended solids (TSS) measurements. TSS loads that will allow compliance with State established turbidity criterion for the watershed have been calculated from relationships established for each sub-basin in the watershed. This TMDL establishes that fluvial erosion processes in the watershed are by far the dominant contributor to these measured parameters. Therefore, this TMDL addresses inorganic suspended solids (i.e., soil and sediment particles from erosion or sediment resuspension) rather than organic suspended solids.

In the Bayou Teche basin TMDL, water quality monitoring stations with historical water quality were evaluated to establish site-specific relationships between turbidity and TSS. Mathematical expressions of this relationship were developed and used to calculate TSS values that if met, would allow compliance with the turbidity guideline in that watershed and reduce the potential for formation of bottom deposits. Because point source contribution of inorganic suspended solids were considered minimal, load allocations for nonpoint source contribution of TSS were set equal to the total allowable loads. An explicit margin of safety of 20% was also incorporated. Necessary reductions range from 0 to 38% with 19 subsegments requiring no reductions in order to meet the established targets. This is not unexpected given that in previous analyses many of these watersheds were found to be meeting the turbidity guidelines established in the Louisiana water quality standards.

1. Introduction

Section 303(d) of the Clean Water Act as amended by the Water Quality Act of 1987, and EPA's regulations at 40CFR130 require that each state identify those waters within its boundaries not meeting water quality standards. Section 303(d) of the Federal Clean Water Act further requires that states develop TMDL management plans for water bodies determined to be water quality limited. A TMDL documents the amount of a pollutant a water body can assimilate without violating a State's water quality standards. It also allocates that load capacity to known point sources and nonpoint sources. TMDLs are defined in 40 CFR Part 130 as the sum of the individual Waste Load Allocations (WLAs) for point sources and Load Allocations (LAs) for nonpoint sources, including a margin of safety and natural background conditions.

2. Study Area Description

2.1 General Information

Bayou Teche basin lies in the Western Gulf Coastal Plain ecoregion. The watershed is characterized as plains/prairie, and the land is generally flat with a very gradual slope toward the Gulf of Mexico. Bayou Teche flows from its headwaters in South Central Louisiana to Charenton Drainage Canal and Lower Bayou Teche (Figure 1). Lower Bayou Teche lies along an alluvial ridge with elevations ranging from 10 feet above sea level near Franklin to 30 feet at Port Barre. The land slopes away from this ridge to the bottomlands and swamps that lie one to three miles away at elevations that are five to ten feet lower than the elevation near the bayou. (LDEQ, 1987) For this reason, local drainage and runoff generally flow away from Bayou Teche, and Bayou Teche functions as a conveyance channel. This is represented in Figure 1. Water is pumped from the Atchafalaya River to Bayou Courtableau and into Bayou Teche. Water is also diverted from Bayou Teche to the Vermilion River via Bayou Fusilier and Ruth Canal. Predominant land uses along Bayou Teche are shown in Table 1.

2.2 Problem Statement

The segments shown in Table 2 were included on the 1999 court-ordered Louisiana 303(d) list as not fully supporting the water quality standard with TSS, siltation, and/or turbidity as the cause of nonsupport. These original assessments were based largely on the best professional judgment of Louisiana Department of Environmental Quality (LDEQ) regional coordinators, often without the benefit of quantitative data. It is believed that informal, qualitative visual observations, not quantitative data, were the basis for many of these listings.

Table 2. 1999 Court ordered listings for the Bayou Teche sub-basin.

LDEQ Subsegment	Segment Description	Cause of Impairment
060101	Spring Creek	TSS
060102	Cocodrie Lake	Siltation
060201	Bayou Cocodrie from US Hwy 167 to the Bayou Boeuf-Cocodrie Diversion Canal	TSS
060202	Bayou Cocodrie	TSS, Siltation
060203	Chicot Lake	TSS
060204	Bayou Courtableau- Origin to West Atchafalaya Borrow Pit Canal	TSS
060205	Bayou Teche- Headwaters at Bayou Courtableau to I-10	TSS
060207	Bayou des Glaisses Diversion Channel/West Atchafalaya Borrow Pit Canal	TSS
060208	Bayou Boeuf- Headwaters to Bayou Courtableau	TSS
060210	Bayou Carron	TSS
060211	West Atchafalaya Borrow Pit Canal	TSS
060212	Chatlin Lake Canal and Bayou du Lac	TSS, Siltation
060301	Bayou Teche- I-10 to Keystone locks and dam	TSS, Turbidity
060401	Bayou Teche- Keystone locks and dam to Charenton Canal	TSS
060501	Bayou Teche- Charenton Canal to Wax Lake outlet	TSS
060601	Charenton Canal	TSS
060701	Tete Bayou	TSS
060702	Lake Fausse Pointe and Dauterive Lake	TSS, Siltation
060703	Bayou du Portage	TSS
060906	Intracoastal Waterway	TSS
060907	Franklin Canal	TSS, Turbidity

2.2.1 Turbidity and TSS

Turbidity is the measure of the optical property that causes light to be either scattered or absorbed. Turbidity may be influenced by a number of factors but is primarily affected by suspended matter such as clay, silt, plankton, or microscopic organisms (APHA, 1992). These are the same components that would contribute to TSS. Although turbidity may be influenced by other factors, effects due to TSS will be captured in a turbidity measure. When evaluations were conducted, using available turbidity data, most of the waters listed for turbidity were found to be meeting the water quality guideline. These waters have been proposed for removal from the court-ordered 303(d) list by separate action (See 65 FR 32148, Dec 18, 2000). Any remaining turbidity listings are addressed in this TMDL.

The State of Louisiana has established acceptable numeric turbidity guidelines for many of its streams including the Mermentau River basin. The State has not established a numerical criterion for TSS. Given that there is no criterion for TSS in the Louisiana water quality standards and that there is a moderate to strong relationship between turbidity and TSS as evidenced by the correlation coefficients shown in Table 3, a listing under both parameters is considered here to be duplicative. A review of the origin of these listings also provides support for this argument. Turbidity listings on the court-ordered list almost always originated from the states 305(b) or 303(d) lists while siltation and TSS listed waters originated largely from the state's nonpoint source list. EPA believes that since this duplicity occurs regularly it supports the belief that these duplicate listings were likely attributable to different ways of expressing the same concern of water impairment by different individuals charged with preparing 305(b) reports 303(d) lists or 319 assessments. Delisting has not been proposed for these segments in order to comply with the strictest interpretation of the consent decree. Independent evaluations have been performed to evaluate TSS as a separate listing.

2.2.2 Siltation

Numerous waters are included on the Louisiana court-ordered 303(d) list as impacted due to siltation. As with TSS, there are no numeric guidelines or criteria for siltation and there is little or no existing information available that would allow a direct evaluation of stream substrate conditions. Louisiana's water quality standards provide a link between suspended solids and bottom deposits, stating that floating, settleable, and suspended solids shall not be present in quantities sufficient to cause long-term bottom deposits. For siltation, a water column measure, or indicator, may be used as a quantitative expression of water quality impacts. A water column characteristic that has been widely used as an indicator of the potential for sediment accumulation in streambeds is suspended sediment (EPA, 1999). Siltation may be described as the effect created as suspended matter from the water column settles to the stream bottom. Water column data for TSS is available from the Louisiana water-quality monitoring network. In this TMDL, TSS is used as an indicator for siltation or bottom deposits resulting from inorganic sediment loads.

2.3 Water Quality Standards

Designated uses include: primary contact recreation; secondary contact recreation; propagation of fish and wildlife; drinking water for Bayou Teche subsegment 060501; and outstanding natural resource waters designations for Spring Creek (060101) and Bayou Cocodrie (060201).

Numeric criteria for turbidity may be found in the Louisiana Water Quality Standards at §1113.B.9. This reads:

“Turbidity

- (a) Turbidity other than that of natural origin shall not cause substantial visual contrast with the natural appearance of the waters of the state or impair any designated water use. Turbidity shall not significantly exceed

background; background is defined as the natural condition of the water. Determination of background will be on a case-by-case-basis.

- (b) As a guideline, maximum turbidity levels, expressed as nephelometric turbidity units (NTU), are established and shall apply for the following named water bodies and major aquatic habitat types of the state:
- i.) Red, Mermentau, Atachafalya, Mississippi, and Vermilion Rivers and Bayou Teche—150 NTU;
 - ii.) Estuarine lakes, bays, bayous, and canals—50 NTU;
 - iii.) Amite, Pearl, Ouachita, Sabine, Calcasieu, Tangipahoa, Tickfaw, and Tchefuncte Rivers—50 NTU;
 - iv.) Freshwater lakes, reservoirs, and oxbows—25 NTU;
 - v.) Designated scenic streams and outstanding natural resource waters not specifically listed in Subsection B.9.b.i-iv of this Section—25 NTU;
 - vi.) For other state waters not included in Subsection B.9.b.i-v of this Section, and in waterbody segments where natural background turbidity exceeds the values specified in these clauses, turbidity in NTU caused by any discharges shall be restricted to the appropriate background value plus 10 percent. This shall not apply to designated intermittent streams.”

Narrative criteria related to the water quality characteristics for TSS and siltation are found at §1113.B.3. This reads:

“Floating, Suspended, and Settleable Solids. There shall be no substances present in concentrations sufficient to produce distinctly visible solids or scum, nor shall there be any formation of long-term bottom deposits of slimes or sludge banks attributable to waste discharges from municipal, industrial, or other sources including agricultural practices, mining, dredging, and the exploration for and production of oil and natural gas. The administrative authority may exempt certain short-term activities permitted under Sections 402 or 404 and certified under Section 401 of the Clean Water Act, such as maintenance dredging of navigable waterways or other short-term activities determined by the state as necessary to accommodate legitimate uses or emergencies or to protect the public health and welfare.”

2.4 Target Determination

To develop a TMDL it is necessary to establish quantitative measures, or indicators, that can be used to establish the relationship between pollutant sources and their impact on water quality. Once an indicator has been selected, a target value for that indicator which distinguishes between the impaired and unimpaired state of the waterbody (e.g. 25 mg/l TSS, or no more than 1000 tons/year sediment yield on average) must be established (USEPA, 1999). Often indicators needed to establish a TMDL are specified as a water quality standard. For example, turbidity no greater than 150 nephelometric turbidity units (NTU) has been adopted as part of the States water quality standards. Often the water quality standard, as in the case with bottom-deposits, is established as a narrative with no associated numeric value. When such numeric values are not available, a target value must be developed for the selected indicator. Where such target values that are representative of the narrative standard are developed, the targets themselves are not water quality standards; rather, they are waterbody-specific numeric targets used by EPA to assess if a water body would be reasonably expected to be impaired based on the state’s narrative standard. In this case the narrative standard addresses suspended solids and its relationship to formation of stream-bottom deposits but does not establish a numeric value for its evaluation.

EPA developed target values or screening levels do not represent a water quality criterion or standard; rather, it is a numeric target used by EPA to assess if a water body would be

reasonably expected to be impaired based on the state's no toxics in toxic amounts narrative criterion.

As previously stated, one method of establishing a TMDL target is to establish a relationship between two measured parameters, one of which has a numeric standard. These TMDLs have been developed using an established relationship between turbidity and TSS. Where such functional relationships are used, they must be derived based on site-specific or comparable reference data.

2.4.1 Establishing the Target

In the Bayou Teche basin, historical water quality data collected by LDEQ from established sub-basin monitoring stations from 1980 to present were evaluated using correlation and simple linear regression analysis to determine the subsegment relationship between turbidity and TSS. Additionally, scatter plots of TSS vs. turbidity, such as the one in Figure 2 were created. As can be seen, the plotted points of turbidity and TSS follow a discernable linear pattern in which TSS increases as turbidity increases. This was expected as indicated in our previous discussion of TSS and turbidity. The strength of this relationship is measured using the correlation coefficient (r). The correlation coefficient can be calculated by taking the square root of the coefficient of determination (R^2) from the regression analysis. As the value of r approaches one, the relationship is said to have a high correlation and thus a strong relationship. Taking the square root of the R^2 value of 0.56 shown in Figure 2 results in a correlation coefficient of 0.75 indicating there is a strong correlation or relationship between these two parameters. Consequently, a meaningful mathematical expression of this relationship may be established using simple linear regression.

A simple linear regression analysis can be used to determine the mathematical equation that represents the relationship between TSS and turbidity. This equation can then be used to predict the TSS value when the turbidity value is known. As mentioned above, a scatter plot can be created to graphically show the relationship between the two parameters by plotting the observed TSS values against the observed turbidity values. Adding the "best fit line" through the points on the graph provides a visually representation of the mathematical equation from the regression analysis and the observed data points. The mathematical equation represented by this "best fit line" can be used to predict a value of y for a given value of x . This line is expressed mathematically by the general formula, $y = b(x) + c$, where y is the predicted value of the dependent variable (TSS in this case), x is the known or observed value of the independent variable (turbidity in this case), b is the slope of the line and c is a constant. This segment specific formula can then used to calculate a TSS concentration, in mg/L, for a given turbidity value.

The strength of the linear relationship is measured by the coefficient of determination (R^2) calculated during the regression analysis (Zar 1996). Therefore, the R^2 value is the percentage of the total variation in y (TSS) that is explained or accounted for by the fitted regression (x). Therefore, using the example above, 56% of the variation in TSS is accounted for by turbidity with the remaining 44% of variation in TSS being unexplained. Applying the formula for the line in Figure 2, a target TSS concentration may be calculated by substituting the appropriate

turbidity guideline (150 NTU) for x and solving the equation for y. The resulting value is the associated TSS value (mg/L) that would allow for compliance with the turbidity guideline (NTU).

Figure 2. Typical Turbidity vs.TSS scatter plot for Bayou Teche.

Using the process described above, coefficient and regression analyses were run for each of the listed subsegments producing separate regression equations. All of the equations were statistically significant at an alpha level of ≤ 0.001 , except subsegments 060210 and 060202, which were statistically significant at an alpha level of 0.16 and 0.02 respectively. (Table 3). From these equations, target TSS values were calculated for each of the listed subsegments in the Bayou Teche watershed. To address the issue of uncertainty each calculated target value has been reduced by 20%. Values shown in Table 3 reflect this reduction. This will be used as an explicit margin of safety.

2.5 TSS Sources

Two primary sources of TSS and sediment are erosional processes in the watershed and resuspension of bottom deposits to the water column. Particulate matter resulting from the weathering of host rock is delivered to stream channels through various erosional processes, including sheetwash, gully and rill erosion, wind, landslides, dry ravel, and human excavation. Additionally, sediments are often produced as a result of stream channel and bank erosion and channel disturbance. Movement of eroded sediments downslope from their points of origin into stream channels and through stream systems is influenced by multiple interacting factors. Eroded sediments are often trapped on hillslopes and stored in and alongside stream channels (US EPA, 1999). During high flow events stored sediment become mobilized and suspend in the water column. As the flow decreases the suspended solids settle downstream. Settled suspended solids (bottom sediment) can become resuspended in the water column during times of increased stream flow and by wind and wave action in shallow lakes.

Table 3. Target calculations for the Bayou Teche watershed.

Sub-Basin Number	Segment Description	Turbidity Guideline (NTU)	TSS Guideline (mg/l)	Current Ambient TSS (mg/L)	Correlation Coefficient (r)	p-value

a – multiple year annual data

sa – semi-annual data (June – December 1998)

2.5.1 Nonpoint Sources

The most significant source of TSS and sediment in this watershed is suspended solids in wet weather runoff. Much of this sediment load comes from upland areas of the watershed that have developed more agricultural uses. Land use analysis shows that 51.6% of the land in the upland area is in cropland or pasture. Sediment load in the lower portions of the watershed, where the predominant land use type is marsh, is a result of inputs from the upland uses and wave and wind action that causes this material to be re-suspended.

2.5.2 Point Sources

Point sources do not represent a significant source of TSS as defined in this TMDL. Point sources discharge primarily organic TSS, which does not contribute to habitat impairment

resulting from sedimentation. Because the point sources are minor contributors and discharges of organic suspended solids from point sources are already addressed by LDEQ through their permitting of point sources to maintain water quality standards for DO, the wasteload allocations for point source contributions were set to zero. This TMDL only addresses the landform contribution of TSS/sediment and does not address the insignificant point source contributions.

3.0 TMDL Load Calculations

3.1 Calculation of Loads

Load allocations are calculated by first calculating the allowable load as expressed by the TSS target value. This is accomplished by the formula:

$$\text{Load (lbs/day)} = \text{Flow (mgd)} * \text{TSS concentration (mg/l)} * 8.34$$

where 8.34 is a constant for unit conversions and concentration values are from Table 3. The resulting values are shown in Table 4

The flow at the outfall of each subsegment was calculated based on the area of the subsegment and a rate that predicts the flow per square mile of area. The stations were used as appropriate to the drainage area under consideration (USGS,1997). The subsegment relationships are graphically represented in Appendix B.

Table 4. Calculation of Target Load Allocations and Current Condition Loads

Sub-segment Number	Stream Description	Flow (mgd)	TMDL Loading (lbs/day)	Ambient		Percent Reduction
				Stream Loading (lbs/day)	20% MOS (lbs/day)	
60101	Spring Creek	88	19816	13211	3963	0%
60102	Cocodrie Lake	249	64376	39457	12875	0%

60906	Intracoastal Waterway	1133	699242	1511875	139848	0%
60907	Franklin Canal	41	24962	13336	4992	0%

3.2 Total Maximum Daily Load

This TMDL is expressed in terms of percent reduction needed to achieve the target TSS load for the listed subsegments. The TSS percent reductions are expressed in Table 4.

3.3 Seasonal Variation

Section 303(d)(1) requires that all TMDLs be “established at a level necessary to implement the applicable water quality standard with seasonal variations”. Seasonal variability was considered in calculating the current condition TSS values. A review of the data shows that, in general, values greater than the target values are more likely to occur in the months of February through May. Because of this uneven distribution of exceedances it was determined that a simple arithmetic mean was not appropriate for establishing the current condition. First, to determine if there was a critical period, the data for a subsegment was segregated into months for which a monthly mean value was calculated. The monthly mean was then compared to the target TSS value. The four months with the greatest average were then averaged to get an estimation of the current ambient condition. For example, in the chart below the months of November through February are the highest four months. The average was taken of all data from

these months to represent the current condition. This approach addresses the critical period for TSS loading.

Figure 3. Monthly means for subsegment 060401

3.4 Margin of Safety

The Clean Water Act requires that each TMDL be established with a margin of safety (MOS). This requirement for a MOS is intended to account for uncertainty in available data or in the actual effect controls will have on the loading reductions and receiving water quality. A MOS may be expressed explicitly as unallocated assimilative capacity or implicitly through conservative analytical assumptions used in establishing the TMDL. The MOS is not intended to compensate for failure to consider known sources. An explicit MOS of 20% is expressed in this TMDL.

4. Reasonable Assurance and Other Relevant Information

LDEQ receives federal funding under the Clean Water Act Section 319(h) Nonpoint Source program. The Louisiana Nonpoint Source Management Plan identifies that the LDEQ will continue to work cooperatively with the federal, state and local partners that assist them in the implementation of statewide educational programs and watershed protection and restoration projects to restore the designated uses of waterbodies. The Management Plan also identifies the State's goal to address nonpoint sources of pollution in the Mermentau/Vermilion basins by the end of 2007. It is anticipated that the state will evaluate if actions have been successful in restoring designated uses in the Mermentau/Vermilion basins by the end of 2008.

Although not required by this TMDL, LDEQ utilizes funds under Section 106 of the federal Clean Water Act and under the authority of the Louisiana Environmental Quality Act to

operate an established program for permitting, enforcement and monitoring the quality of the state's surface waters. The LDEQ Surveillance Section collects surface water samples at various locations, utilizing appropriate sampling methods and procedures for ensuring the quality of the data collected. The objectives of the surface-water monitoring program are to determine the quality of the state's surface waters, to develop a long-term database for water quality trend analysis, and to monitor the effectiveness of pollution controls. The data obtained through the surface-water monitoring program is used to develop the state's biennial 305(b) report (*Water Quality Inventory*) and the 303(d) list of impaired waters. This information is also utilized in establishing priorities for the LDEQ nonpoint source program.

The LDEQ has implemented a watershed approach to surface water quality monitoring. Through this approach, the entire state is sampled over a five-year cycle with two targeted basins sampled each year. Long-term trend monitoring sites at various locations on the larger rivers and Lake Pontchartrain are sampled throughout the five-year cycle. Sampling is conducted on a monthly basis or more frequently if necessary to yield at least 12 samples per site each year. Sampling sites are located where they are considered to be representative of the waterbody. Under the current monitoring schedule, targeted basins follow the TMDL priorities. In this manner, the first TMDLs will have been established by the time the first priority basins are monitored again in the second five-year cycle. This will allow the LDEQ to determine whether there has been any improvement in water quality following establishment of the TMDLs. As the monitoring results are evaluated at the end of each year, waterbodies may be added to or removed from the 303(d) list. The sampling schedule for the first five-year cycle is shown below. The Vermilion-Teche River Basin will be sampled again in 2003.

1998 – Mermentau and Vermilion-Teche River Basins
1999 - Calcasieu and Ouachita River Basins
2000 – Barataria and Terrebonne Basins
2001 – Lake Pontchartrain Basin and Pearl River Basin
2002 – Red and Sabine River Basins

(Atchafalaya and Mississippi Rivers will be sampled continuously.)

5. Public Participation

When EPA establishes a TMDL, 40 C.F.R. § 130.7(d)(2) requires EPA to publicly notice and seek comment concerning the TMDL. Pursuant to an October 1, 1999, Court Order, EPA prepared this TMDL. After submission of this TMDL to the Court, EPA commenced preparation of a notice seeking comments, information and data from the general and affected public. Comments and additional information were submitted during the public comment period and this Court Ordered TMDL was revised accordingly. EPA has transmitted this revised TMDL to the Court, and to the Louisiana Department of Environmental Quality (LDEQ) for incorporation into LDEQ's current water quality management plan.

The flow at the outfall of each subsegment was calculated based on the area of the subsegment and a rate that predicts the flow per square mile of area. Four stations were used to establish the rates and calibrate the flows at the observed stations. ***The stations were used as appropriate to the drainage area under consideration.*** This method uses the gage flow to be a composite of the base flow of the stream, the rainfall runoff on the drainage area above that point, the distributaries, the withdrawals from the stream, the point discharges, and return flow of the withdrawals from the stream. Four stations were used to prepare the subsegment flows for basin 6. The stations were 07382500 on Bayou Courtableau; 07383500 on Bayou Des Glaisses; 07385500 on Bayou Teche, Arnaudville; 07385700 on Bayou Teche, Keystone. The segment relationships are graphically represented below. An Ishikawa type diagram was used to represent the tributary system of the basin in a spreadsheet format. Each row of the spreadsheet represents one subsegment, or a subsegment transfer flow. The subsegment number for the row will be listed in one of three columns. The far left column has the subsegments that represent the main stem of the stream, flowing from the top of the page down. Tributary subsegments are listed in the second or third column with the label “seg”. The point that the tributary flows into the main stem is represented by a horizontal line under the segment number extending to the left and intersecting with the column one vertical line (which represents the main stem). Multiple subsegments on a tributary will be depicted with a vertical in the “seg” column, with horizontal lines tying into it. The lowest tributary subsegment that flows into the main stem will have a horizontal line under the segment number extending to the left and intersecting with the column one vertical line. A tributary to a tributary will be shown in the third column labeled “seg”. For readability, the subsegment number has been repeated in the last column on the right. To obtain the average flow at the outflow of a subsegment, find the subsegment number in the far right column. The column to the left will be the flow in MGD, the column to the left of that will be the flow in CFS.

APPENDIX C: Ambient Monitoring Data

SITE	SUBSEGMENT	SITE NAME	DATE	TURB	TDS	TSS
